

<Marine Organism Rearing Log>

9 AM, August 18, 2022

Weather: Drizzle

Water temperature: 18.4°C

We transferred freshly picked sea lettuce into the tank after rinsing thoroughly with clean seawater. However, univalve shells are still attached on the sea lettuce and sticking to the tank. They are still too small to determine its species, they might provoke negative effects on pumps if they start breeding. Apparently, little green shrimps are in the tank.
