

<Marine Organism Rearing Log>

9 AM, August 19, 2022

Weather: Sunny

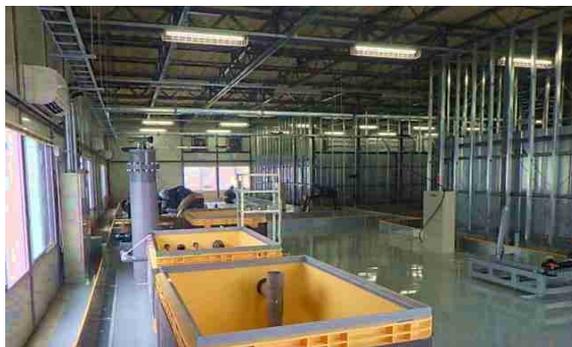

Water temperature: 18.3°C

Training rearing on normal seawater.

Two abalones were found dead on the morning of August 17, under rearing training. Declining quality of rearing water is thought to be the cause of death.

On the other hand, preparation of rearing test within the controlled area is steadily in progress. The tanks and other items were carrying in the area starting August 16.

<Next update will be on August 22, 2022.>

The tanks under preparation in the controlled area
