

<Marine Organism Rearing Log>

9 AM, August 31, 2022

Weather: Cloudy with occasional showers

Water temperature: 17.8°C

Status of rearing training (normal seawater)

The quality of seawater is improved, yet, we still are better-prepared. We were unable to deworm completely at the time of the move in July. The eggs of parasites still were detected and we will narcotize and examine their gills for anemia on the flounders. If we found any symptoms, we would perform saltwater bathing.
