

<Marine Organism Rearing Log>

9 AM, September 6, 2022

Weather: Sunny

Water temperature: 18.2°C

Flounders change their body coloration to their environment and turn darker when in bad conditions. We found a flounder being slightly darker so we narcotized and performed thorough medical examination on it. In the result, we found it is perfectly healthy without any parasites. It seems visually impaired so it might be the reason of dark coloration.
