

<Marine Organism Rearing Log>

9 AM, October 5, 2022

Weather: Rainy

Water temperature: 18.9°C

We transferred about 60 flounders from regular seawater to rearing water of approx. 1,500 Bq/L of tritium concentration then started verification test of tritium concentration in flounders' bodily fluids. An hour, 3 hours, 9 hours, and 24 hours later, we take 5 flounders out at each time and verify the time course of tritium concentrations in their bodily fluids.
