

<Marine Organism Rearing Log>

9 AM, October 6, 2022

Weather: Rainy

Water temperature: 19.1°C

The following results are confirmed that the working environment of caretakers (ambient dose measurement) remains same before and after adding ALPS treated water (Sept. 29 and Oct. 5) as well as the contamination and dust inside the rearing room are below measureable limits which could cause interfusion of radioactive substances beside tritium in the tanks. The data will be posted on TEPCO's Web page later.
