

## <Marine Organism Rearing Log>

9 AM, April 26, 2023

Weather: Rainy

Water temperature: 18.5°C

The waste fluid from protein skimmers, with which feces and leftover feed from the flounders and abalones are filtered out, decomposes spontaneously in the tanks, producing a sulfur odor. Ozone is then injected into the tanks to deodorize the odor. Since ozone is also poisonous to humans, we ventilate facility frequently and posted warning signs.
