

<Marine Organism Rearing Log>

9 AM, May 9, 2023

Weather: Cloudy

Water temperature: 17.8°C

We started test culture of seaweed (brown algae: gulfweed) today. As with flounders and abalones, we put the seaweed in a tank filled with the ALPS treated water added seawater (concentration of tritium: approx. 1,300 Bq/L) to check the uptake status, and then the excretion status after transferring them into normal seawater.
