

<Marine Organism Rearing Log>

9:00 AM, July 7, 2023,

Weather: Sunny

Water temperature: 18.5°C

The first thing we learned from the experts about caring for flounder and abalone was how individual organisms react to increases in water temperature. For this reason, we procured a spot cooler that can be attached to any breeding tank as a contingency for overcoming extreme heat waves.

<Next report will be on July 10, 2023>

The number of expired abalones and the number removed for research

	No. of expired abalones		Removed for research	
	6/30-7/6 (No.)	Survival Rate (%, Accumulated)	6/30-7/6 (No.)	Accumulated (No.)
Regular seawater①	3	71.6	0	0
Regular seawater②	3	64.5	0	0
ALPS-treated water added①	2	64.1	0	0
ALPS-treated water added②	2	59.1	0	1

\* For accuracy, counted from Friday of the previous week to Thursday.

\* No expired flounder
