

<Marine Life Rearing Log>

9 AM, September 6, 2023

Weather: Rainy

Water temperature: 18.6°C

An abalone was placed in a transparent case and a video of its underside (belly) was taken. The abalone moves around by undulating its abdominal legs (belly: white part) . The red branch-like folds around the abdominal legs are also part of the legs and used to sense tidal currents and obstacles.

Check out the video on X (formerly Twitter).
