

<Marine Organism Rearing Log>

9 AM, December 11, 2023

Weather: Sunny

Water temperature: 17.4°C

Tritium in seawater ingested by flounder replaces the hydrogen in the organic compounds that form muscle through the metabolic process. This is referred to as organically-bound tritium (OBT). These analysis results were obtained about one year after the start of the rearing test. The tritium concentration peaks at about 200 becquerels/L.
